ANALYTICS CLOUD DASHBOARD JSON OVERVIEW

To create advanced dashboards in Analytics Cloud, it might be necessary to directly modify the JSON that defines a dashboard.

The easiest way to design dashboards is to use the designer. However, to complete the following tasks, you must modify the dashboard's JSON file.

- Specify a SAQL query, and specify relationships between the query and other steps.
- Populate a selector with a specified list of values instead of from a query.
- Use manual bindings to override the default faceting and manually specify the relationships between the steps.
- Set query limits.
- Specify columns for a values table.
- Change the layout of your dashboard from absolute to grid.

VIEW OR MODIFY A DASHBOARD JSON FILE

To create advanced dashboards, it might be necessary to modify the JSON file that defines a dashboard.

1. In your browser's address bar, type the URL of the Create Lens page. For example, if your Salesforce.com instance is `na3.salesforce.com`, type `https://na3.salesforce.com/insights/web/lens.apexp` in your browser's address bar.
2. In the list of lenses, click the lens to modify it.
The JSON that defines that lens is displayed in the Lens text box. To increase the size of the text box, click and drag the resizing handle in its bottom right corner.
3. Modify the JSON in the Lens text box. Optionally, cut and paste the text into a text editor or JSON editor, make your changes, and then paste it back into the text box.
4. Click **Update Lens**.
The changes are saved.

EDITIONS

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To modify the JSON file that defines a dashboard:

- "Create and Edit Analytics Cloud Dashboards"

DASHBOARD JSON FILE EXAMPLE

A dashboard JSON file defines the components that a dashboard contains and describes how they're connected together.

This sample JSON file defines a simple dashboard that uses a number widget to display the count of rows in a dataset. This sample JSON file defines one lens, called "step_1", and one widget, called "number_1". The "edgemarts" section lists all of the datasets that the dashboard uses. The "layouts" section specifies a grid layout with one page, one row, and one column.

```
{
  "name_lc": "simple example dashboard",
  "state": {
    "widgets": {
      "number_1": {
        "params": {
          "title": "",
          "textColor": "#000",
          "measureField": "count",
          "fontSize": 36,
          "step": "step_1"
        },

}
```

STEPS

The `steps` section contains all of the queries that you've clipped from the explorer.

Each step has a name that's used to link it to a widget that's defined elsewhere in the JSON file.

The properties of the steps section of a dashboard JSON file are:

Field Name	Description
<code>em</code>	The alias of the dataset that this step uses.
<code>extra</code>	Extra information about the step.
<code>isFacet</code>	Indicates whether the step will be connected to other steps used in the dashboard (<code>true</code>) or not (<code>false</code>), that reference the same dataset.  Note: Faceting only works for compact form queries (not SAQL).
<code>isGlobal</code>	Indicates whether the filter that's specified in the query will be used as a global filter (<code>true</code>) or not (<code>false</code>). A global filter will filter all other steps in the dashboard that have their <code>useGlobal</code> property set to <code>true</code> , and reference the same dataset.  Note: <code>isGlobal</code> only works for compact form queries (not SAQL).
<code>query</code>	The query that the step uses. It can be in SAQL or compact form.
<code>selectMode</code>	Determines the selection interaction. The options for charts are: <code>none</code> , <code>single</code> , and <code>single_required</code> . The options for list and toggle selectors are: <code>single</code> , <code>single_required</code> , <code>multi</code> , and <code>multi_required</code> . <code>selectMode</code> is not available for number, raw data, compare, range, date, and global filter widgets.
<code>start</code>	The default start value or values for a step. This value will be used when a dashboard is initialized or refreshed.
<code>type</code>	The type can be set to <code>grain</code> , <code>aggregate</code> , <code>multi</code> , or <code>static</code> .
<code>useGlobal</code>	Indicates whether the step should use the dashboard's global filter (<code>true</code>) or not (<code>false</code>).  Note: <code>useGlobal</code> only works for compact form queries (not SAQL).

IN THIS SECTION:

[Static Steps](#)

You can also populate a selector from a specified list of static values, instead of from a query.

Static Steps

You can also populate a selector from a specified list of static values, instead of from a query.

A static step is shown in this example. This static step is used for filtering, but static steps can also be created for groups, measures, sort order, and limits.

```
"steps": {
  "step_static_00null": {
    "type": "static",
    "dim": "Stages",
    "em": "opp",
    "values": [
      {
        "display": "1",
        "value": "1",
        "measure": 100000
      }, {
        "display": "2",
        "value": "2",
        "measure": 200000
      }, {
        "display": "3",
        "value": "3",
        "measure": 300000
      }, {
        "display": "4",
        "value": "4",
        "measure": 400000
      }, {
        "display": "5",
        "value": "5",
        "measure": 500000
      }
    ]
  }
}
```

```
    },  
    "selectMode": "single"  
  },  
}
```

For more information, see [Selection Binding in a Static Step](#).

WIDGETS

The *widgets* section defines all of the widgets that appear in the dashboard. Each widget has a name.

The properties of the widgets section of a dashboard JSON file are:

Field Name	Description
<code>params</code>	Widget parameters vary depending on the type of widget. The step that a widget is attached to is defined by its <code>step</code> element. For detailed information about different parameters, see Widget Parameters Property Reference .
<code>pos</code>	The top left corner of the widget is specified by <code>x</code> and <code>y</code> . Width is <code>w</code> , and height is <code>h</code> . Measurements are in pixels.
<code>type</code>	The widget type specifies one of the other supported widget types: <ul style="list-style-type: none">• <code>NumberWidget</code>• <code>ChartWidget</code>• <code>ValuesTable</code>• <code>CompareTable</code>• <code>PillBox</code>• <code>ListSelector</code>• <code>TextWidget</code>• <code>BoxWidget</code>• <code>YoutubeWidget</code>• <code>LinkWidget</code>• <code>GlobalFiltersWidget</code>• <code>RangeSelector</code>• <code>DateSelector</code>

IN THIS SECTION:

[Widget Parameters Property Reference](#)

The `params` property of the `widgets` section defines the attributes of a widget in a dashboard. Each widget has its own `params` property.

SEE ALSO:

[Widget Parameters Property Reference](#)

Widget Parameters Property Reference

The `params` property of the `widgets` section defines the attributes of a widget in a dashboard. Each widget has its own `params` property.

The parameters available for each widget depend on the widget's `type` property. For example, a `ChartWidget` can have the `legend` parameter, but a `TextWidget` can't.

Some parameters are exposed and editable in the dashboard designer's user interface as widget properties. Others are only editable via JSON.

This example excerpt from a dashboard JSON file describes a dashboard with a single `ChartWidget`. The `ChartWidget` has four parameters set: `miniBars`, `chartType`, `sqrt`, and `step`.

```
"widgets": {
  "chart_1": {
    "params": {
      "miniBars": 14,
      "chartType": "vbar",
      "sqrt": true,
      "step": "Customer_Name_1"
    },
    "type": "ChartWidget",
    "pos": {
      "w": 1000,
      "zIndex": 0,
      "y": 20,
      "h": 500,
      "x": 20
    }
  }
}
```

The widget properties set by the `params` property are:

Property Name	Details
backgroundColor	<p>Type</p> <p>string</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> BoxWidget <p>Exposed in the Dashboard Designer's User Interface</p> <p>Yes</p> <p>Description</p> <p>The color of the background.</p> <p>Specify the color in this format: <code>rgb (a, b, c, d)</code>.</p> <p>Using a number between zero and 255, a indicates how much red is in the color, b how much green, and c how much blue. A value of 0 indicates the absence of a color, and a value of 255 indicates the full expression of a color.</p>

Property Name	Details
	<p>Using a number between zero and one, d indicates the level of transparency. A value of 0 is invisible and 1 is opaque.</p> <p>For example, <code>rgb(0, 0, 0, 0.93)</code> sets the color to a nearly opaque black. <code>rgb(255, 0, 0, 0.14)</code> sets the color to a nearly invisible red.</p> <p>Alternatively, the color can be set using hexadecimal notation. When using hexadecimal notation, transparency can't be set. All hexadecimal colors default to opaque. <code>#000000</code> indicates black in hexadecimal. <code>#ff0000</code> indicates red.</p>
<code>borderColor</code>	<p>Type string</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>BoxWidget</code> <p>Exposed in the Dashboard Designer's User Interface Yes</p> <p>Description The color of the border.</p> <p>Specify the color in this format: <code>rgb(a, b, c, d)</code>.</p> <p>Using a number between zero and 255, a indicates how much red is in the color, b how much green, and c how much blue. Only applicable when <code>multiMetrics</code> is <code>true</code>.</p>
<code>sqrt</code>	<p>Type boolean</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>ChartWidget</code> <p>Exposed in the Dashboard Designer's User Interface Yes</p> <p>Description Indicates whether charts are displayed using a logarithmic scale (<code>true</code>) or a linear scale (<code>false</code>).</p>
<code>step</code>	<p>Type string</p>

Property Name	Details
	<p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>CompareTable</code> • <code>DateSelector</code> • <code>GlobalFiltersWidget</code> • <code>ListSelector</code> • <code>NumberWidget</code> • <code>PillBox</code> • <code>RangeSelector</code> • <code>ValuesTable</code> <p>Exposed in the Dashboard Designer's User Interface Yes</p> <p>Description The name of the lens that supplies data for the widget.</p>
<code>stretch</code>	<p>Type boolean</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>BoxWidget</code> <p>Exposed in the Dashboard Designer's User Interface Yes</p> <p>Description Indicates whether an image's width and height are set to the same values of the widget's width and height (<code>true</code>) or not (<code>false</code>).</p>
<code>text</code>	<p>Type string</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>TextWidget</code> <p>Exposed in the Dashboard Designer's User Interface Yes</p> <p>Description The message rendered in a text widget. For example, if <code>text</code> is assigned the value <code>"Hello, world!"</code>, then "Hello, World!" appears in the text widget.</p>
<code>textAlignment</code>	<p>Type string</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>TextWidget</code>

Property Name	Details
	<p>Exposed in the Dashboard Designer's User Interface</p> <p>Yes</p> <p>Description</p> <p>The alignment of text. Possible values include <code>left</code>, <code>center</code>, and <code>right</code>. If no value is specified, text alignment defaults to center.</p>
<code>textColor</code>	<p>Type</p> <p>string</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • <code>NumberWidget</code> • <code>TextWidget</code> <p>Exposed in the Dashboard Designer's User Interface</p> <p>Yes</p> <p>Description</p> <p>The font color of text.</p> <p>Specify the color in this format: <code>rgb(a, b, c, d)</code>.</p> <p>Using a number between zero and 255, a indicates how much red is in the color, b how much green, and c how much blue. A value of 0 indicates the absence of a color, and a value of 255 indicates the full expression of a color.</p> <p>Using a number between zero and one, d indicates the level of transparency. A value of 0 is invisible and 1 is opaque.</p> <p>For example, <code>rgb(0, 0, 0, 0.93)</code> sets the color to a nearly opaque black. <code>rgb(255, 0, 0, 0.14)</code> sets the color to a nearly invisible red.</p> <p>Alternatively, the color can be set using hexadecimal notation. When using hexadecimal notation, transparency can't be set. All hexadecimal colors default to opaque. <code>#000000</code> indicates black in hexadecimal. <code>#ff0000</code> indicates red.</p> <p>.</p>

QUERY

The *query* section defines the query for that step.

The properties of the *query* section of a dashboard JSON file are:

Field Name	Description
<code>pigql</code>	The SAQL query to use. The SAQL language is a real-time query language that uses data flow as a means of aligning results. It enables ad hoc analysis of data that's stored in datasets.
<code>dimensions</code>	<p>The dimensions to use are specified like this:</p> <pre>"dimensions": ["Department"]</pre>
<code>measures</code>	<p>The measures to use are specified like this:</p> <pre>"count", "*", null, { "display": "% of total flights" }</pre> <p>Should be specified for both compact and SAQL query formats. It needs to be specified for SAQL queries so that the associated chart widget can render the correct projections. You can change the UI label of a measure by setting the <code>display</code> option.</p>
<code>values</code>	<p>Values are used with the <code>grain</code> step type in a step for a raw data table widget. Values list all of the columns to include in a grain or raw data table. For example:</p> <pre>"step_grain": { "type": "grain", "em": "opp", "query": { "values": ["Amount", "Owner-Name", "Name", "Account-Name", "StageName", "ForecastCategory", "Current Age", "Time to Win"], } }</pre> <p>Values should be specified for both compact and SAQL query formats.</p>
<code>filters</code>	<p>The filter conditions to apply to the data. Here is an example of a simple filter condition to include only rows that have the destination "SFO", "LAX", "ORD", or "DFW":</p> <pre>"filters": [{"dest", ["SFO", "LAX", "ORD", "DFW"]}]]</pre>
<code>groups</code>	The dimension to group by. For example, <code>"groups": ["carrier"]</code> . Groups should be specified for both compact and SAQL query formats
<code>order</code>	<p>The sort order is specified like this:</p> <pre>"order": [[-1, { "ascending": false }]]</pre> <p>The value, -1, indicates that the ordering will be done for the first measure. To order the results in ascending order, set ascending to <code>true</code>. To order the results in descending order, set ascending to <code>false</code>. If you</p>

Field Name	Description
	don't want to impose a specific order, specify empty brackets like this: <code>"order": []</code> . Can be specified for both compact and SAQL query formats.
limit	The number of results to return. For example, <code>"limit": 10</code> . The results that are returned by the limit statement aren't automatically ordered, so you must use this statement only with data that has been ordered.
formula	<p>Formula is used with the <i>multi</i> step type in a step for a compare table. In a <i>multi</i> type step, there is more than one subquery. You can use the basic mathematical operators, <code>*</code>, <code>/</code>, <code>-</code>, <code>+</code>, <code>(</code>, and <code>)</code>, to create a formula to reference other subqueries in the step. To reference other subqueries, use the automatically assigned names: "A" is the first query, "B" is the second query, and so on.</p> <pre> "step_comptable": { "type": "multi", "em": "opp", "isFacet": true, "useGlobal": true, "query": { "columns": [{ "header": "Opptys Won", "query": { "pigql": null, "filters": [["StageName", ["5 - Closed-Won"]], ["Close Date", [[["year", -1], ["year", 0]]]]], "measures": [["count", "*"]], "values": [], "groups": ["Owner-Name"], "formula": null, "order": [] } }, { "header": "Opptys Won (\$)", "query": { "pigql": null, "filters": [["StageName", ["5 - Closed-Won"]]], "measures": [["sum", "Amount"]], "values": [], "groups": ["Owner-Name"], "formula": null, "order": [] } }], "sort": { "asc": false, "inner": false }, "header": "Opptys Won (\$)", "showBars": true, "query": { "pigql": null, "filters": [["StageName", ["5 - Closed-Won"]]], "measures": [["sum", "Amount"]], </pre>

Field Name	Description
	<pre> "values": [], "groups": ["Owner-Name"], "formula": null, "order": [] } }, { "header": "Opptys Lost (\$)", "query": { "pigql": null, "filters": [["StageName", ["5 - Closed-Lost"]]], "measures": [["sum", "Amount"]], "values": [], "groups": ["Owner-Name"], "formula": null, "order": [] } }, { "header": "Opptys Lost (\$)", "showBars": true, "query": { "pigql": null, "filters": [["StageName", ["5 - Closed-Lost"]]], "measures": [["sum", "Amount"]], "values": [], "groups": ["Owner-Name"], "formula": null, "order": [] } }, { "header": "Win-Loss (%)", "query": { "groups": ["Owner-Name"], "filters": [["StageName", ["5 - Closed-Lost"]]], "measures": [["sum", "Amount"]], "values": [], "pigql": null, "formula": "B/(B+D)*100", "order": [] } }] } }, </pre>
aggregateFilters	Automatically generated. Do not modify.
facet_filters	Automatically generated. Do not modify.

Within the query section of a step, you can manually insert bindings. To do this, use templates, which are expressions that are embedded in double braces ({{ }}) and that get replaced with the current state of the step that they are attached to. For example:

```
"filters": [{"carrier", "{{ selection(step1) }}"}, {"dest", "{{ filter(step1, 'dest') }}"}, {"origin", "{{ filter(step1, 'origin') }}}"]
```

IN THIS SECTION:

[Query Example](#)

This example shows a dashboard that contains two queries.

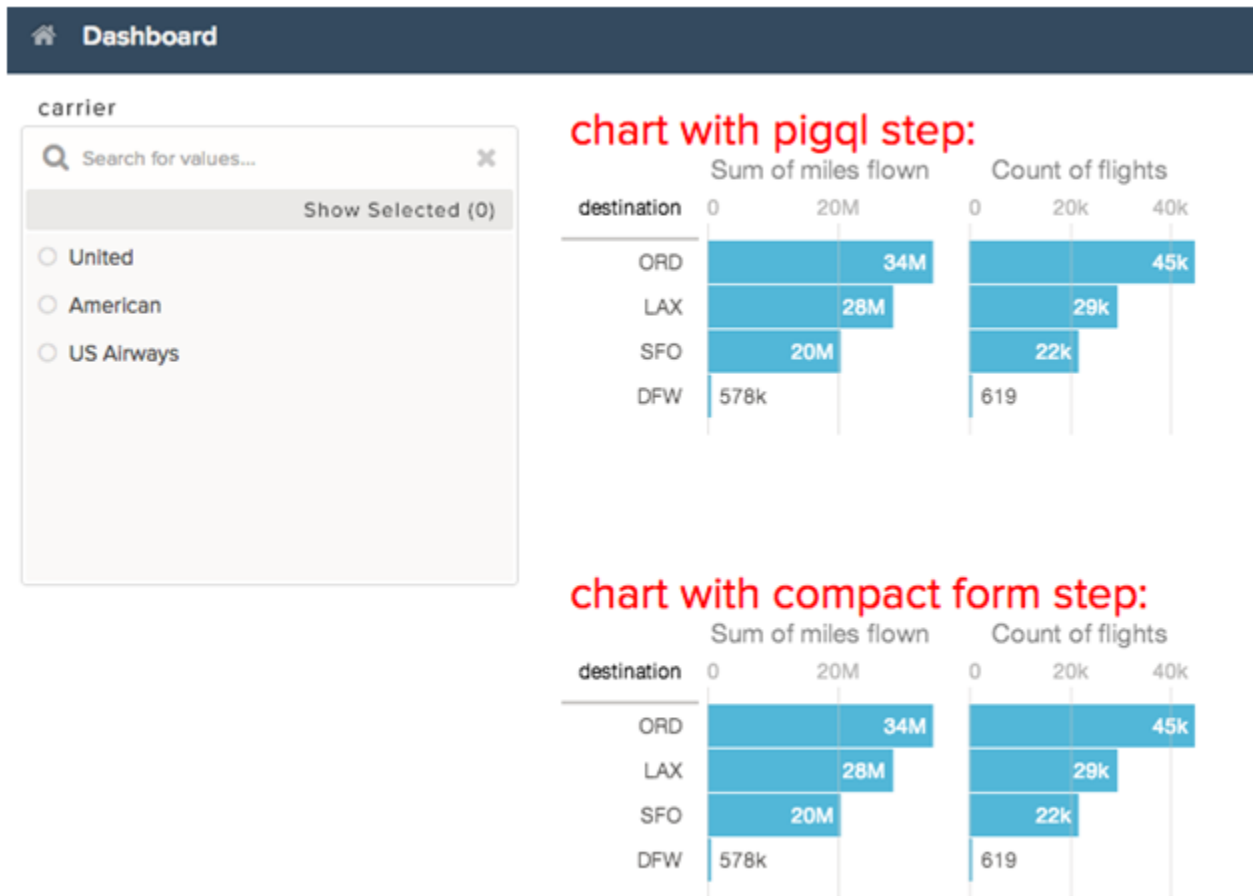

Query Example

This example shows a dashboard that contains two queries.

The first bar chart is connected to a step (step3) that contains a query that uses SAQL. The second bar chart is connected to a step (step2) that contains a compact form query. Both the compact and the SAQL steps have selection filters that are bound to step1. Clicking on one chart filters the others.

In step3, the full SAQL query is placed within the "piqql": reference. The SAQL query is used instead of the compact query references. However, the compact form elements of "groups" and "measures" still need to be specified, so that the associated chart widget can render the correct projections (for a "grain" type query the "values" would need to be specified). In this example the 'sum_miles' and 'count' projections in the SAQL query are then referenced in measures as [{"sum", "miles"}, {"count", "*"}]. Measure projections in the SAQL need to include the aggregation underscore ("_") and the name of the measure ('sum_miles'), so that it can be referenced in the compact form "measures": [{"sum", "miles"}].

For more information about SAQL, see the *Explorer SAQL Reference*.

}
```

BINDINGS

After you define steps, you bind them to the widgets.

The kinds of bindings are:

- Selection binding
- Results binding

Selection Binding

When a user makes a selection on a widget in a dashboard, that selection value can be used to update other steps and widgets to make the dashboard interactive. This is referred to as faceting.

When you build a dashboard with the dashboard builder UI, by default, everything is faceted. The "isFaceted" option for each step takes care of bidirectional selection bindings between steps of the same dataset. However, you can modify a dashboard JSON file directly to manually specify the relationships between the various step to achieve:

- Selection bindings between steps of different datasets.
- Unidirectional selection binding.
- Selection binding for a static step.

Results Binding

Results binding is used to filter a step using the values resulting from another step. It's typically used across multiple datasets. An example of when results binding is useful is when you want to filter opportunities by top-selling products.

```
step_all_salesreps:
  type: "aggregate"
  em: "opp"
  query:
    groups: ["Owner-Name"]
    filters: [
      ["StageName", ["5 - Closed-Won"]]
      ["Products", "{ results(step_top5_products) }"]
    ]
  measures: [ ["sum", "Amount"] ]
```

In the following example, the resulting sum of miles from the first step ("all_miles") is used in the second step to calculate the average.

```
"steps": {
  "all_miles": {
    "type": "aggregate",
    "em": "airline",
    "query": {
      "measures": [ ["sum", "miles"], ["count", "*"] ]
    }
  },
  "step_percent": {
```

```

"type": "aggregate",
"em": "airline",
"query": {
  "pigql": "q = load \"airline\";\nq = group q by 'carrier';\nq =
    foreach q generate 'carrier' as 'carrier', sum('miles')/{
      value(results(all_miles, 'sum_miles')) } * 100 as 'sum_miles',
    count()/{ value(results(all_miles, 'count')) } * 100 as 'count';\nq =
    order q by 'sum_miles' desc;",
  "groups": ["carrier"],
  "order": [
    [
      ["sum", "miles"], {
        "ascending": false
      }
    ]
  ],
  "measures": [
    [
      "sum", "miles", null, {
        "display": "% of total miles"
      }
    ], [
      "count", "*", null, {
        "display": "% of total flights"
      }
    ]
  ]
}
}

```

IN THIS SECTION:

[Selection Binding in a Static Step](#)

Almost all parts of a step can include a selection binding to the results of a prior query.

[Bind a Static Filter and Group Selector to a Query](#)

Static filters or group selectors can be bound to a query written in SAQL.

[Relative Dates in a Static Filter Selector](#)

Static steps can use relative dates to filter queries.

[Binding Operations](#)

You can use several additional operations with results and selection bindings to extract the correct results.

Selection Binding in a Static Step

Almost all parts of a step can include a selection binding to the results of a prior query.

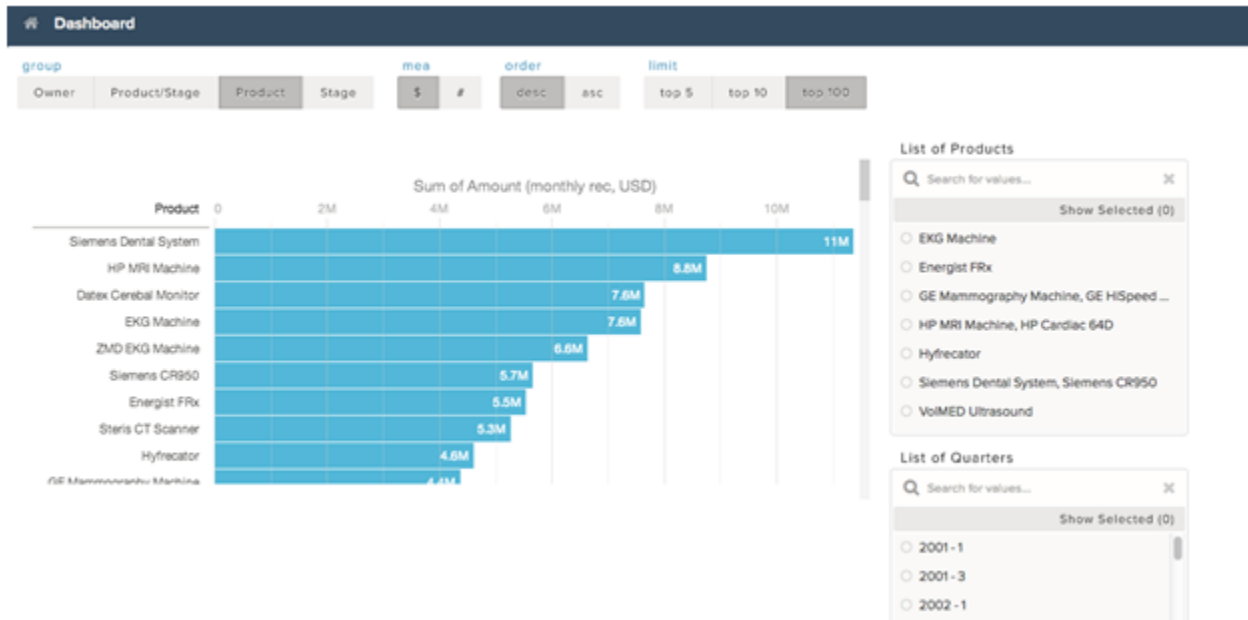

In an aggregate query, the fields that can be included in a selection binding are:

- Group
- Measure
- Filters

- Sort
- Limit

Use Static Steps for Binding Any Part of a Query

This example shows a dashboard with static steps and selection bindings in multiple parts of a query.

In the following example:

- The static step `step_filter_dim` populates the "List of Products" list selector. It includes options that have multiple values.
- The static step `step_group` populates the group toggle selector. "Product" is the default value when the dashboard is initialized, because the `start` value is "Product". The `display` values change the display name in the user interface.
- The static step `step_measure` populates the measure toggle selector.
- The static step `step_order` populates the order toggle selector.
- The static step `step_limit` populates the limit toggle selector.
- The aggregate step query `step_quarterly_bookings` is grouped by close-date year and quarter.
- The aggregate step query `step_top_10` has groupings that are dependent on the selection option from the static `step_group`. The `start` value will be the "Product" grouping (based on `step_group`).

```
{
  "steps": {
    "step_filter_dim": {
      "type": "static",
      "dim": "Product",
      "em": "opp",
      "selectMode": "single",
      "values": [
        {
          "value": ["EKG Machine"]
        }
      ]
    }
  }
}
```

```

    }, {
      "value": ["Energist FRx"]

```

Bind a Static Filter and Group Selector to a Query

Static filters or group selectors can be bound to a query written in SAQL.

Templates are expressions, embedded in double braces ({{ }}), that get replaced with the current state of the step that they're attached to.

For example, this dashboard contains a static filter widget that contains a list of accounts. The dashboard also contains a group selector widget that lets users indicate whether they want to group by account or product. When a user makes a selection, the chart is updated accordingly. The part of the query that controls the filtering is:

```
q = filter q by 'Account-Name' in {{ selection(step_Account_Owner_Name_2) }};
```

The step that's named `step_Account_Owner_Name_2` is configured as a selection binding so that it will pick up the current selection state. Because it's within the double braces, the value of that selection will be substituted and used in the query.

The part of the query that controls the grouping is:

```
q = group q by {{ single_quote(value(selection(step_StageName_3))) }};
q = foreach q generate {{ single_quote(value(selection(step_StageName_3))) }} as {{
value(selection(step_StageName_3)) }}, sum('Amount') as 'sum_Amount', count() as 'count';
```

If a user selects Product in the group selector widget, the actual query that will be passed to the query engine contains:

```
q = group q by 'Product';
q = foreach q generate 'Product' as "Product", sum('Amount') as 'sum_Amount', count() as
'count';
```

Note: To view the query that's used to update the chart, open your browser's JavaScript console and type `edge.log.query=true`. On the dashboard, select a different group. The new query will appear in the console unless the query has been cached.

```
"steps": {
  "step_Account_Name_1": {
    "isFacet": false,
    "query": {
      "pigql": "q = load \"opp\";\nq = filter q by 'Account-Name' in {{
selection(step_Account_Owner_Name_2) }};\nq = group q by {{
single_quote(value(selection(step_StageName_3))) }};\nq = foreach q generate {{
single_quote(value(selection(step_StageName_3))) }} as {{ value(selection(step_StageName_3))
}}, sum('Amount') as 'sum_Amount', count() as 'count',
      \"groups\": \"{{ selection(step_StageName_3) }}\",
      \"measures\": [\"sum\", \"Amount\"]
```

```

    },
    "extra": {
      "chartType": "hbar"
    },
    "selectMode": "none",
    "useGlobal": true,
    "em": "opp",
    "type": "aggregate",
    "isGlobal": false
  },
  "step_Account_Owner_Name_2": {
    "dim": "Account-Name",
    "isFacet": false,
    "values": [
      {
        "value": ["Lakeside Med", "Hospital at Gulfport", "Hospital at Carbondale"],
        "display": "Arbuckle Laboratories, Arbuckle Laboratories - Austria, Arbuckle Laboratories - France"
      }, {

    "isGlobal": false
  }
}
```

Relative Dates in a Static Filter Selector

Static steps can use relative dates to filter queries.

This example demonstrates how to create a static step that uses relative dates to filter another query.

```
{
  "step_date_static": {
    "type": "static",
    "dim": [
      [
        "CreatedDate_Year",
        "CreatedDate_Month"
      ]
    ],
    "values": [
      {
        "display": "last 6 years",
        "value": [
          [
            [
              "year",
              -6
            ],
            [
              "year",
              0
            ]
          ]
        ]
      },
      {
        "display": "last 5 years",
        "value": [
          [
            [
              "year",
              -5
            ],
            [
              "year",
              0
            ]
          ]
        ]
      }
    ]
  }
}
```

```

        ]
      }
    ],
    "selectMode": "single_required"
  },
  "compact_step_faceted_by_static": {
    "type": "aggregate",
    "em": "opp",
    "query": {
      "groups": [
        "Product"
      ],
      "filters": [
        [
          "CreatedDate",
          "{{selection(step_date_static)}}]"
        ]
      ],
      "measures": [
        [
          "sum",
          "Amount"
        ]
      ],
      "limit": 2000
    },
    "isFacet": false
  },
  "pigql_step_faceted_by_static": {
    "type": "aggregate",
    "em": "opp",
    "query": {
      "pigql": "q = load \"opp\";\nq = filter q by date('CreatedDate_Year',
        'CreatedDate_Month', 'CreatedDate_Day') in
        {{selection(step_date_static)}};\nq = group q by 'Product';\nq =
        foreach q generate 'Product' as 'Product', sum('Amount') as
        'sum_Amount', count() as 'count';\nq = limit q 2000;",
      "groups": [
        "Product"
      ],
      "measures": [
        [
          "sum",
          "Amount"
        ]
      ],
    },
    "isFacet": false,
    "useGlobal": true
  }
}

```

Binding Operations

You can use several additional operations with results and selection bindings to extract the correct results.

value()

The `value()` operation is used to get a selector array value and convert it to a single value (or null if the array is empty).

single_quote()

The `single_quote()` operation is typically used in selection bindings in a SAQL step to correctly format the "group" and "for each generate" lines in the query. The `single_quote()` operation takes an array of values and converts double quotes into single quotes and square brackets into parentheses. For example: `"Owner-Name"` converts to `'Owner-Name'` and `["Owner-Name", "Owner-Region"]` converts to `('Owner-Name', 'Owner-Region')`.

Consider the following static selector, with the array values `["Account-Name"]` and `["Product"]`:

```
{
  "step_StageName_3": {
    "isFacet": false,
    "values": [
      {
        "value": [
          "Account-Name"
        ],
        "display": "Account"
      },
      {
        "value": [
          "Product"
        ],
        "display": "Product"
      }
    ],
    "useGlobal": true,
    "em": "opp",
    "type": "static",
    "selectMode": "single_required",
    "isGlobal": false
  }
}
```

The following example binds the array values to a SAQL query that requires the "group by" and "foreach generate" values to use single quotes. Therefore `single_quote()` converts `["Account-Name"]` to `'Account-Name'`.

```
{
  "step_Account_Name_1": {
    "isFacet": false,
    "query": {
      "pigql": "q = load \"opp\";\nq = group q by
              {{ single_quote(value(selection(step_StageName_3))) }};\nq =
              foreach q generate {{ single_quote(value(selection(step_StageName_3)))
              }} as {{ single_quote(value(selection(step_StageName_3))) }},
```

```

        sum('Amount') as 'sum_Amount', count() as 'count'",
"groups": "{ { selection(step_StageName_3) } }",
"measures": [
    [
        "sum",
        "Amount"
    ]
]
},
"extra": {
    "chartType": "hbar"
},
"selectMode": "none",
"useGlobal": true,
"em": "opp",
"type": "aggregate",
"isGlobal": false
}
}

```

The resulting query is:

```

q = load "opp"; \nq = group q by 'Account-Name'; \nq =
    foreach q generate 'Account-Name' as 'Account-Name', sum('Amount') as
        'sum_Amount', count() as 'count'

```

no_quote()

The `no_quote()` operation is typically used in selection bindings in a SAQL step to correctly format the "order" line in a query. The `no_quote()` operation takes an array of values and converts double quotes and square brackets into no quotes. For example, `["desc"]` converts to `desc`.

Consider the `["desc"]` and `["asc"]` array values specified in the following static step:

```

{
    "step_order": {
        "type": "static",
        "values": [
            {
                "display": "desc",
                "value": [
                    "desc"
                ]
            },
            {
                "display": "asc",
                "value": [
                    "asc"
                ]
            }
        ],
        "selectMode": "single_required"
    }
}

```

The following example binds the array values into a SAQL step:

```
q = order q by 'Amount' {{ no_quote(value(selection(step_order))) }} }
```

The desc or asc value is inserted without any quotes:

```
q = order q by 'Amount' desc
```

field()

The `field()` operation creates a field for each object in an array.

Three field values are assigned to the "\$" and "#" options in this static step (`step_measure`): "compact", "alias", and "proj":

```
{
  "step_measure": {
    "type": "static",
    "values": [
      {
        "display": "$",
        "value": [
          {
            "compact": ["sum", "Amount"],
            "alias": "sum_Amount",
            "proj": "sum('Amount') "
          }
        ],
        "display": "#",
        "value": [
          {
            "compact": ["count", "*"],
            "alias": "count",
            "proj": "count()"
          }
        ]
      }
    ],
    "selectMode": "single_required"
  }
}
```

Once assigned, each field value can be referenced in other step selection bindings using the `field()` operation.

For example, when a dashboard user clicks # in the toggle selector that uses `step_measure`, the SAQL query in this aggregate step (`step_top_10`) references the "proj" field to insert a `count()` function, the "alias" field to insert "count" as a string, and the "compact" field to insert `["count", "*"]`.

```
{
  "step_top_10": {
    "type": "aggregate",
    "em": "opp",
    "query": {
      "pigql":
        "q = load 'edgemarts/Opportunity/OpportunityEM';
        q = group q by 'Account_Name';"
```

```

q = foreach q generate
  'Account_Name' as 'Account_Name',
  {{ no_quote(value(field(selection(step_measure), 'proj')))) }}
  as {{ single_quote(value(field(selection(step_measure), 'alias')))) }};
q = order q by {{ single_quote(value(field(selection(step_measure), 'alias')))) }}
  {{ no_quote(value(field(selection(step_order), 'pigql')))) }};
q = limit q {{ value(selection(step_limit)) }};";
"groups": ["Account_Name"],
"measures": "{{ value(field(selection(step_measure), 'compact')) }}",
"order":
  [[ -1, { "ascending": "{{ value(field(selection(step_order), 'compact')) }}" } ]]
},
"isFacet": true
}

```

LAYOUTS

Add a *layouts* section to your dashboard's JSON definition to customize its appearance on mobile devices.

There are two types of dashboard layouts:

Absolute (default layout)

If no *layouts* section is defined in your dashboard's JSON, then the dashboard's layout is absolute.

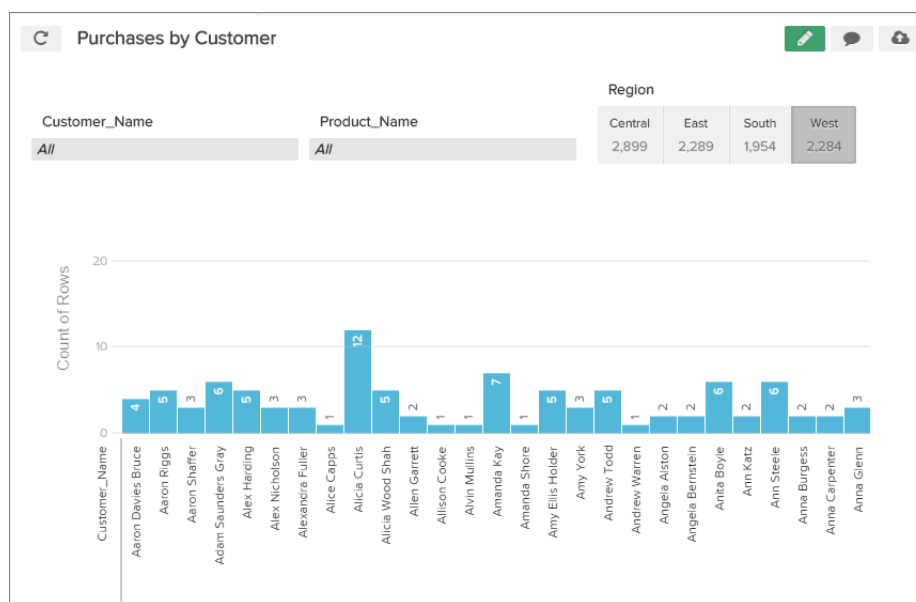

The absolute layout is optimized for display in a Web browser on a desktop or laptop computer.

Grid

If a *layouts* section is present in your dashboard's JSON, then the dashboard's layout is grid.

The grid layout lets you optimize the position, order, and size of the widgets in your dashboard for display on mobile devices. The grid layout is made up of rows, columns, and cells, as well as pages. Each cell in the grid can contain zero or more widgets. The number of rows, columns, and cells in your grid layout depend on the number of widgets and the number of pages.

A dashboard with an absolute layout looks great in a Web browser:

The same dashboard with an absolute layout may not render well on a smart phone:

Layouts

By using a grid layout with two pages, the dashboard renders perfectly on a smart phone:

IN THIS SECTION:

[Use a Grid Layout for Your Dashboard](#)

Use a grid layout to customize your dashboard’s appearance on mobile devices.

[Understanding Column, Row, and Cell Sizing in Grid Layouts](#)

Widgets size, row size, and the number of columns are determined dynamically, but can also be specified in the JSON.

[Layouts Specification](#)

The “*layouts*” section is used to customize how dashboards display on mobile devices.

[Layouts Attribute Reference](#)

Set attributes on widgets, rows, and cells to customize their height, width, padding, and more.

Use a Grid Layout for Your Dashboard

Use a grid layout to customize your dashboard’s appearance on mobile devices.

1. Find your dashboard’s JSON by following the instructions in [View or Modify a Dashboard JSON File](#).
2. Add a *layouts* section to your dashboard’s JSON.

For example, this *layouts* section defines a grid layout with two pages, two rows of widgets on each page. The first page has one widget on each row. The second page has two widgets on the first row, and one widget on the second row.

```
"layouts": {
  "default": {
    "page:0": [
      "buttongroup_2",
      "chart_1"
    ],
    "page:1": [
      "dimfilter_1 | dimfilter_3",
      "chart_1"
    ]
  }
}
```

3. Optionally, customize the layout of your dashboard by setting attributes for each widget and row.

For example, the *layouts* from step two can be updated to include widget and row attributes. The first row on the first page has a row height of 300 pixels. The chart widget on the second page has a width of two columns.

```
"layouts": {
  "default": {
    "page:0": [
      "buttongroup_2" | row:{height=300}",
      "chart_1"
    ],
    "page:1": [
      "dimfilter_1 | dimfilter_3",
      "chart_1 {colspan=2}"
    ]
  }
}
```

4. Optionally, set device-specific and orientation-specific layouts for your dashboard.

For example, the *layouts* from step three can be updated to use only one page when viewed on an iPad in landscape mode:

```
"layouts": {
  "default": {
    "page:0": [
      "buttongroup_2",
      "chart_1"
    ],
    "page:1": [
      "dimfilter_1 | dimfilter_3",
      "chart_1 {colspan=2}"
    ]
  },
  "device:ipad, orientation:landscape": {
    "page:0": [
      "dimfilter_1 | dimfilter_3 | buttongroup_2",
      "chart_1 {colspan=3}"
    ]
  }
}
```

5. From the dashboard JSON page, click **update lens** to save your dashboard's edited JSON.
6. Test your dashboard's new grid layout by viewing the dashboard on a mobile device.

[Layouts Specification](#)

Understanding Column, Row, and Cell Sizing in Grid Layouts

Widgets size, row size, and the number of columns are determined dynamically, but can also be specified in the JSON.

How Column Number and Size Are Set

The number of columns in your grid layout is equivalent to the number of widgets in your rows. If there are three widgets in each row, then the dashboard has three columns. If your grid layout has two rows with four widgets in row one and five widgets in row two, then the dashboard has five columns. If the `colspan` attribute specifies a number of columns greater than the number of widgets in any row, then the dashboard adds columns to accommodate the `colspan` attribute.

For example, a dashboard with this *layouts* section has three columns on the first page and two columns on the second page:

```
"layouts": {
  "default": {
    "page:0": [
      "buttongroup_2",
      "chart_1 {colspan=3}"
    ],
    "page:1": [
      "dimfilter_1 | dimfilter_3",
      "chart_1"
    ]
  }
}
```

```

    ]
  }
}

```

Remember these tips when determining how many columns are in your grid layout:

- All columns have the same width. If your dashboard has four columns, then each column is half the width of a dashboard with two columns.
- Each page of a dashboard independently determines how many columns appear. For example, a dashboard can have three columns on page one, and four columns and page two.
- Every dashboard has at least one column.
- There is no limit to the number of columns that a dashboard can have. If you add too many columns, then column width could become impractically small. Remember to test your layout for usability!

How Row Number and Height Are Set

For each row, here's how height is calculated:

- If a row height is set using the `height` attribute, then the row's height is equal to the specified value.
- If one or more widgets in the row has a preferred height, then the row's height is equal to that of whichever preferred height is tallest.
- If there is no `height` attribute and none of the row's widgets have a preferred height, then the row's height dynamically grows to occupy the available space. If multiple rows grow dynamically, then their heights are equal to one another. For example, if there are 200 pixels of available space, and two rows with dynamically set heights, then each row has a height of 100 pixels.

How Widgets Are Sized

Some widgets have absolute sizes, and some scale dynamically.

Widget	Has a Fixed Width?	Has a Fixed Height?	Width Scaling Behavior	Height Scaling Behavior
Link	Yes	Yes	Don't scale	Don't scale
Text	No	If one line long, yes. If more than one line long, no.	Scale to fit text	Scale to fit text
PillButton	No	Yes	Scale	Don't scale
Box	No	No	Scale	Scale
Chart	No	No	Scale	Scale
List	No	Yes	Scale	Don't scale
Range	No	Yes	Scale	Don't scale
Number	No	Yes	Scale	Don't scale

Layouts Specification

The “*layouts*” section is used to customize how dashboards display on mobile devices.

In a dashboard’s JSON file, the “*layouts*” section is a child of the “*state*” section and a sister of the “*widgets*” and “*steps*” sections. Here is an example of a typical “*layouts*” section:

```
"layouts": {
  "default": {
    "page:0": [
      "widget_name_1",
      "widget_name_2"
    ],
    "page:1": [
      "widget_name_3 | widget_name_4",
      "widget_name_2 {attribute=2}"
    ]
  },
  "device:ipad, orientation:landscape":{
    "page:0": [
      "widget_name_1 | widget_name_3 | widget_name_4 | row: {attribute=300}",
      "widget_name_2 {widget_name=3}"
    ]
  }
}
```

In the prior example, *widget_name* refers to a specific widget named in the “*widgets*” section of the JSON file. *Attribute* refers to one of the attributes listed in the [Layouts Attribute Reference](#). Cells are delimited by the pipe character (|) with a space on either side of the pipe (|). Rows are delimited by a comma (,).

Here’s a simple “*layouts*” section that has four widgets on four rows in a single column on a single page:

```
"layouts": {
  "default": {
    "page:0": [
      "buttongroup_1",
      "dimfilter_1",
      "dimfilter_2",
      "chart_1"
    ]
  }
}
```

A more complex “*layouts*” section can be used to set device-specific and orientation-specific display rules. The following “*layouts*” section lays out the dashboard’s widgets on two pages. The first page’s first row has a height of 300 pixels. The second page has two rows and two columns. One of the cells in the first row contains two widgets. One of the box widgets has three attributes set. The chart widget spans two columns. If the dashboard is viewed on an iPad in landscape mode, then only one page with two rows is shown. The first row has three widgets and the second row has one widget that spans three columns.

```
"layouts": {
  "default": {
    "page:0": [
      "buttongroup_2 | row: {height=300}",
      "chart_1"
    ],

```

```

    "page:1": [
      "dimfilter_1 | dimfilter_2, box_1 {zIndex=-1, vpad=5, hpad=5}",
      "chart_1 {colspan=2}"
    ]
  },
  "device:ipad, orientation:landscape":{
    "page:0": [
      "dimfilter_1 | dimfilter_2, box_1 {zIndex=-1, vpad=5, hpad=5} | buttongroup_2",
      "chart_1 {colspan=3}"
    ]
  }
}

```

Here's an example dashboard JSON file that includes a `"layouts"` section:

```

{
  "name_lc": "purchases by customer",
  "state": {
    "widgets": {
      "buttongroup_1": {
        "params": {
          "measureField": "count",
          "step": "Region_3"
        },
        "type": "PillBox",
        "pos": {
          "w": 280,
          "zIndex": 1,
          "y": 30,
          "x": 540
        }
      },
      "chart_1": {
        "params": {
          "chartType": "vbar",
          "step": "Customer_Name_1"
        },
        "type": "ChartWidget",
        "pos": {
          "w": 810,
          "zIndex": 0,
          "y": 150,
          "h": 470,
          "x": 10
        }
      },
      "dimfilter_1": {
        "params": {
          "measureField": "count",
          "expanded": false,
          "step": "Customer_Name_1"
        },
        "type": "ListSelector",
        "pos": {
          "w": 250,

```

```

    "zIndex": 100001,
    "y": 50,
    "h": 50,
    "x": 10
  }
},
"dimfilter_2": {
  "params": {
    "measureField": "count",
    "expanded": false,
    "step": "Product_Name_2"
  },
  "type": "ListSelector",
  "pos": {
    "w": 250,
    "zIndex": 100002,
    "y": 50,
    "h": 50,
    "x": 280
  }
}
},
"steps": {

Layouts Attribute Reference

Set attributes on widgets, rows, and cells to customize their height, width, padding, and more.

Widget Attributes

These attributes can be set on widgets. Each widget can have zero or more attributes.

Property Name	Details
colspan	<p>Type integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> all widgets <p>Description The width of the widget in columns. When setting a <code>colspan</code> attribute on a widget, the cell that contains the widget spans across columns. If there aren't enough columns in the dashboard to accommodate the width specified by <code>colspan</code>, then columns are added to the dashboard.</p> <p>Example In this example, the widget named "chart_1" spans three columns:</p> <pre>"layouts": { "default": { "page:0": ["dimfilter_1 dimfilter_2 dimfilter_3", "chart_1 {colspan=3}"] } }</pre>
rowspan	<p>Type integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> all widgets

Property Name	Details
	<p>Description</p> <p>The number of rows that a widget spans. When setting a <code>rowspan</code> attribute on a widget, the cell containing the widget spans across rows. If there aren't enough rows in the dashboard, then rows are added.</p> <p>Example</p> <p>In this example, the widget named <code>"dimfilter1_1"</code> spans two rows:</p> <pre>"layouts": { "default": { "page:0": ["dimfilter_1 {rowspan=2} dimfilter_2", "chart_1"] } }</pre>
<code>zIndex</code>	<p>Type</p> <p>integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> all widgets <p>Description</p> <p>The position of a widget relative to other widgets in the dashboard. <code>zIndex</code> specifies whether a widget is in front of or behind another widget. A smaller <code>zIndex</code> means that a widget appears further behind other widgets with larger <code>zIndex</code> values.</p> <p>The default value of <code>zIndex</code> is 0.</p> <p>Example</p> <p>In this example, the widget named <code>"box_1"</code> appears behind the widget named <code>"number_1"</code>:</p> <pre>"layouts": { "default": { "page:0": ["box_1 {zIndex=1}, number_1 {zIndex=2} chart_1"] } }</pre>
<code>vpad</code>	<p>Type</p> <p>integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> all widgets <p>Description</p> <p>The padding added to the top and bottom sides of the widget's cell in pixels. If <code>vpad</code> equals 10, then 10 pixels are added to the top of the cell and 10 pixels are added to the bottom.</p> <p>The default value of <code>vpad</code> is 0.</p>

Property Name	Details
	<p>Example</p> <p>In this example, the cell containing widget named “<code>dimfilter_1</code>” has 5 pixels of padding on its top and bottom sides:</p> <pre> "layouts": { "default": { "page:0": ["dimfilter_1 {vpad=5}"] } }</pre>
<code>hpad</code>	<p>Type integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> all widgets <p>Description</p> <p>The padding added to the left and right sides of the widget’s cell in pixels. If <code>hpad</code> equals 10, then 10 pixels are added to the left side of the cell and 10 pixels are added to the right side. A negative value can be assigned to</p> <p>The default value of <code>hpad</code> is 0.</p> <p>Example</p> <p>In this example, the cell containing widget named “<code>dimfilter_1</code>” has 5 pixels of padding on its top and bottom sides:</p> <pre> "layouts": { "default": { "page:0": ["dimfilter_1 {hpad=5}"] } }</pre>
<code>yAxisWidth</code>	<p>Type integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> Chart Widget (<code>ChartWidget</code>) <p>Description</p> <p>The size of a chart widget’s x-axis in pixels. Use <code>yAxisWidth</code> to align multiple chart widgets.</p> <p>Example</p> <p>In this example, the widget named “<code>chart_1</code>” has an x-axis that is 250 pixels wide:</p> <pre> "layouts": { "default": { "page:0": [</pre>

Property Name	Details
	<pre> "chart_1 {yAxisWidth=250}"] } }</pre>
hAxisHeight	<p>Type integer</p> <p>Available for These Widgets</p> <ul style="list-style-type: none"> • Chart Widget (ChartWidget) <p>Description The size of a chart widget's y-axis in pixels. Use <code>hAxisHeight</code> to align multiple chart widgets.</p> <p>Example In this example, the widget named "chart_1" has a y-axis that is 250 pixels tall:</p> <pre> "layouts": { "default": { "page:0": ["chart_1 {hAxisHeight=250}"] } }</pre>

Row Attributes

These attributes can be set on rows.

Property Name	Details
height	<p>Description If <code>height</code> is set to a number, then <code>height</code> is the height of a row in pixels. If <code>height</code> is set to <i>preferred</i>, then the row's height is equal to the largest height</p> <p>Example In this example, the first row's height is 300 pixels. The second row's height is equal to the height of its tallest widget:</p> <pre> "layouts": { "default": { "page:0": ["chart_1 {colspan=3} row:{height=300}", "dimfilter_1 buttongroup_1 number_1 row:{height=preferred}"] } }</pre>

Property Name	Details
	<pre>} }</pre>
